Abstract

During the past decade, conceptual models were developed for public health systems development and for the evaluation of the performance of these systems. Simultaneously, there was an increased demand to improve the relevance of education to practice in public health, because of the need to develop staff for a changing public health system.

This study assesses the need for public health practice in Thailand, which facilitated the development of a relevance assessment instrument that was, then, applied through an evaluation of the Learning @ the Workplace Program. This was done with the expectation that the outcomes will be of local use but that the processes involved can be generalised.

An embedded case study design was used, applying quantitative and qualitative approaches through consensus panels, a mailed questionnaire, focus group discussions, semi-structured interviews, in-depth interviews, self-administered questionnaires and archival research.

Ten Public Health Practices were identified for Thailand, among these 'Health Promotion', 'Health Insurance' and 'Decentralisation' were considered to be the top priorities.

Eleven Public Health Services were identified. Prioritisation showed that none of the 11 Services was considered to be a Strength, 5 were Satisfactory and 6 were considered to be a Weakness. The Weaknesses were 'Monitor (population health)', 'Diagnose and Investigate (problems and hazards)', 'Partnerships', 'Enforce Laws', 'Evaluation' and 'Research'.

Participants believed that the Services 'Monitor', 'Diagnose and Investigate' and 'Access to Services' were very important. Except 'Policy Development', which was considered to be less important, all of the other Services were considered important.

Perceptions on Involvement of Staff in Services showed that Front-line Staff only participates, Mid-level Management Staff was considered to participate in all Services except for 'Disseminate Information' and 'Evaluation' for which they share responsibility with Top-level Management Staff, who were considered as responsible for all Services.

Considering the relationships between Public Health Practices and Services the participants believed that the Practice 'Health Promotion' would affect all Services. The following Practices were considered to only affect a few Services: 'System Reform', 'Civil Society Capability' and 'Develop Health Industry'.

Considering the Services, 'Assure Human Resources' would be most frequently affected by the Practices. The Services 'Monitor', 'Diagnose and Investigate', 'Evaluation' and 'Research' would be less frequently affected by the Practices.

Seventy Public Health Skills were identified and the required Levels of Skill Mastery were examined for 3 Staff Categories. Almost all of these Skills (67/70) were considered to be Core Skills for Front-line Staff. For these Core Skills, Front-line Staff were required to have Awareness on 13 Skills, to be Knowledgeable in 50 Skills and to be Proficient in 4 Skills. For both Mid-level and Top-level Management Staff all 70 Skills were considered to be Core Skills. Mid-level Management Staff were required to be Knowledgeable in 53 Skills and Proficient in 17 Skills. Top-level Management Staff were considered to have Awareness on 1 Skill, to be Knowledgeable in 35 Skills and to be Proficient in 34 Skills.

Participants considered which of the 70 Public Health Skills should be attributed to which of the 11 Services. The Service 'Planning and Management', had the highest number of Skills (52) attributed to it and the Service 'Enforce Laws', the lowest number of Skills (7). Of all 70 Skills, 57 were attributed across Services that were considered to be a Weakness. Findings also showed that the Services 'Monitor', 'Diagnose and Investigate', 'Evaluation' and 'Research' share similar Skills.

The public health system in Thailand requires a professional MPH Program that is orientated to health system reform and development. The participants in the study believed that the main Target Group for the Learning @ the Workplace Program should be Mid-level Management Staff with a health or non-health Bachelor Degree from any functional level within the provincial health system. Their main Learning Need was considered to be; applied quantitative and qualitative research and analytical skills, used in the development of interventions (problem solving), as well as project formulation, management, communication and evaluation skills.

They also believed that there is a need for communication, collaboration and co-ordination among national and provincial partners and a clear need for mutual gain among all partners.

Based on the need assessment outcomes a relevance assessment instrument was developed and tested. This showed good reliability coefficients in the various units of analysis. Triangulation proved to be important in dealing with the social desirability bias.

The Learning @ the Workplace Program's purpose and objectives were congruent with the need considered by those involved in the practice of public health. At the Instructional Level, the Curriculum Design was not congruent with professional need.

Findings should be useful for local curriculum development. The process applied in this assessment may also be of use for those interested in improving the relevance of public health education.

Key words: public health, education, relevance, needs assessment.

Acknowledgements

I sincerely express my gratitude to Professor Dr. Chitr Sitthi-amorn, the founding Dean of this College, who offered me the opportunity to do my Doctoral study. He provided me with a scholarship, offered me a position on the academic staff and provided me with resources for my research through the China Medical Board Project. His dedication to offering chances to those with potential made a dream come true for me.

In addition to this support, I was more than fortunate being able to work closely with Professor Dr. Edgar J. Love, Senior Consultant to the College and my Co-Advisor. I admire him not only because of his outstanding knowledge and rich experience, but also because of his dedication and wisdom in guiding me. Without his guidance I would never have been able to complete this long, challenging and often painful journey.

My special thanks go to my Advisory Committee: to Associate Professor Dr. Ong Arj Viputsiri who was so kind to be my Advisor, to Associate Professor Dr. Wattana S. Janjaroen, to Assistant Professor Dr. Nuntavarn Vichit-Vadakan and Assistant Professor Dr. Alisara Chuchat, whose warm support and active participation in various workshops and meetings throughout my study made me feel cared for.

I would like to mention the China Medical Board's support to the College of Public Health since its establishment and Dr. Roy Schwartz, the president of the China Medical Board, who guaranteed support for the further development of the Learning @ the Workplace Program. It was an honour for me being able to contribute to the achievement of this development project's objectives.

I own gratitude to Dr. Samlee Pliangbangchang, Dean of the College, who reduced my responsibilities as an academic staff to a minimum, so that I could concentrate on writing my

Dissertation. As well as to Associate Professor Swin Suwan who chaired the Examination Committee.

Thanks also to the members of the Joint Public Health Education Team and the Continuous Quality Improvement Team of the China Medical Board Project. Their motivation and active support were crucial in the various phases of my study.

I would like to mention late Professor Dr. Prapont Piyaratn who developed the foundations for the Learning @ the Workplace Program in Thailand and Dr. Stephen King who encouraged me to study the relevance of learning to practice.

Further, I want to thank my colleagues, the library staff and all support staff in the College for their kind support and friendship that created not only a warm and homely environment but also for direct assistance in taking over some of my tasks when needed.

Last but not least my special thanks go to Ms. Montira Inkochasan and Mr. Tithikorn Trayaporn, my research assistants. For two years we worked together as a real team. A team in which each of us had our own strengths complementing those of the others. Our paths in life are parting but our friendship will survive.

Finally, I would like to dedicate this study to my parents Hubert and Maria, my brother Paul and my sister Greet.
