ภาคผนวก ก.การคำนวณช่วงความเชื่อมั่นของอัตราความคลาดเคลื่อนที่ระบุ (T)

วิธีคำนวณเกณฑ์ในการตัดสินใจอัตราความคลาดเคลื่อนที่ระบุ (nominated) ซึ่งสามารถคำนวณจากช่วงความเชื่อมั่นของ p เมื่อ p หมายถึงโอกาสที่เกิดจากความคลาดเคลื่อนประเภทที่ 1 ดังนี้

$$\hat{p} - z_{\alpha/2} \sqrt{\frac{\hat{p}\hat{q}}{n}} \leq p \leq \hat{p} + z_{\alpha/2} \sqrt{\frac{\hat{p}\hat{q}}{n}}$$

เมื่อ $\alpha = .05$ ได้ว่า $\hat{p} = .05$ $\hat{q} = 1 - \hat{p} = .95$, $n = 1,000$ และ $z_{\alpha/2} = 1.96$

เพราะฉะนั้น

$$.05 - 1.96 \times \sqrt{\frac{(.05)(.95)}{1000}} \leq p \leq .05 + 1.96 \times \sqrt{\frac{(.05)(.95)}{1000}}$$

$$.05 - .0135083 \leq p \leq .05 + .0135083$$

$$0.0364917 \leq p \leq 0.0635083$$

เมื่อ $\alpha = .01$ ได้ว่า $\hat{p} = .01$, $\hat{q} = .99$, $n = 1,000$, $z_{\alpha/2} = 2.576$

เพราะฉะนั้น

$$.01 - 2.576 \sqrt{\frac{(.01)(.99)}{1000}} \leq p \leq .01 + 2.576 \sqrt{\frac{(.01)(.99)}{1000}}$$

$$.0081051 \leq p \leq .0181051$$

สรุปช่วงของความเชื่อมั่นสำหรับ $p = .05$ คือ $.036 \leq p \leq .064$

$p = .01$ คือ $.008 \leq p \leq .018$

หมายเหตุ เกณฑ์ของโคแธนกำหนดช่วงของความเชื่อมั่นดังนี้

สำหรับ $p = .05$ คือ $.040 \leq p \leq .060$

$p = .01$ คือ $.007 \leq p \leq .015$

เพราะเหตุที่เกณฑ์ของโคแรนนั้นเป็นช่วงที่สั้นกว่าช่วงความเชื่อมั่นที่คำนวณได้ และ Ramsey ได้ใช้เกณฑ์ของโคแรนในการตัดสินอัตราความคลาดเคลื่อนประเภทที่ 1 ของการทดสอบที่ การวิจัยครั้งนี้จึงเลือกใช้เกณฑ์ของโคแรนตัดสินการเปรียบเทียบอัตราความคลาดเคลื่อนประเภทที่ 1 จากผลการทดลองกับอัตราความคลาดเคลื่อนที่ระบุ

การทดสอบความแตกต่างกันของสัดส่วนของอำนาจของการทดสอบ

ทำการทดสอบความแตกต่างอย่างมีนัยสำคัญทางสถิติของสัดส่วนของอำนาจของการทดสอบด้วยการทดสอบซี (Z-test) และ เนื่องจากทดลองนี้ทำการซิมูเลชันเพียง 1,000 ครั้ง เพื่อประหยัดการทำงานของเครื่องคอมพิวเตอร์จึงกำหนดอัตราความคลาดเคลื่อนที่ระบุสำหรับการทดสอบซีเท่ากับ .10

ทดสอบความแตกต่างอย่างมีนัยสำคัญของอำนาจของการทดสอบของ t-(NN,5) กับ w-(NN,5), T-(NN,5), v-(NN,5) เมื่อเดลต้ามีค่าเท่ากับ 0.25σ และกำหนดอัตราความคลาดเคลื่อนที่ระบุ .05

$$\text{จากสูตร} \quad Z = \frac{\hat{p}_1 - \hat{p}_2}{\sqrt{\frac{\hat{p}_1 \hat{q}_1}{n_1} + \frac{\hat{p}_2 \hat{q}_2}{n_2}}}$$

เมื่อ \hat{p}_1 คือสัดส่วนของอำนาจของการทดสอบของ t-(NN,5)

\hat{p}_2 คือสัดส่วนของอำนาจของการทดสอบของ w-(NN,5)

\hat{q}_1 คือ $(1-\hat{p}_1)$

n_1 คือจำนวนครั้งของการทดลองหาค่าของอำนาจของการทดสอบของ t-(NN,5)

n_2 คือจำนวนครั้งของการทดลองหาค่าของอำนาจของการทดสอบของ w-(NN,5)

$$\begin{aligned} \therefore Z &= \frac{0.069 - 0.063}{\sqrt{\frac{(.069)(.931)}{1000} + \frac{(.063)(.937)}{1000}}} \\ &= 0.5404089 \end{aligned}$$

ไม่มีเหตุผลเพียงพอที่จะสรุปว่า อำนาจของการทดสอบของ $t-(NN,5)$, $w-(NN,5)$, $T-(NN,5)$, $V-(NN,5)$ ณ จุดนี้แตกต่างกันอย่างมีนัยสำคัญทางสถิติที่ระดับ .10 นั่นคือที่เดลต้ามีค่าเท่ากับ 0.25σ และกำหนดอัตราความคลาดเคลื่อนที่ระบุ .05 การทดสอบของ $t-(NN,5)$, $w-(NN,5)$ และ $T-(NN,5)$ มีอำนาจของการทดสอบใกล้เคียงกัน

ทดสอบความแตกต่างอย่างมีนัยสำคัญของอำนาจของการทดสอบของ $t-(NN,10)$ กับ $T-(NN,10)$ เมื่อเดลต้ามีค่าเท่ากับ 1.25σ และกำหนดอัตราความคลาดเคลื่อนที่ระบุ .01

จากสูตร

$$Z = \frac{\hat{p}_1 - \hat{p}_2}{\sqrt{\frac{\hat{p}_1\hat{q}_1}{n_1} + \frac{\hat{p}_2\hat{q}_2}{n_2}}}$$

$$\therefore Z = \frac{0.491 - 0.401}{\sqrt{\frac{(.491)(.509)}{1000} + \frac{(.401)(.599)}{1000}}}$$

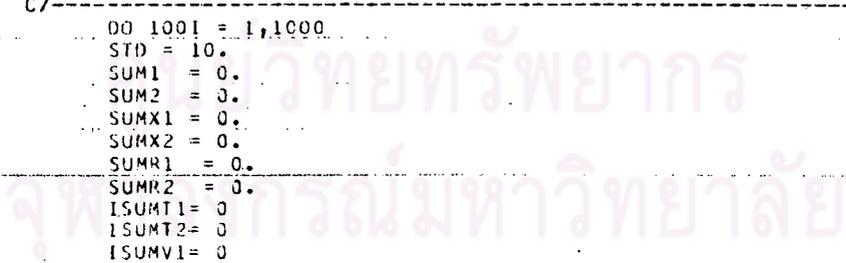

$$= 4.0652961$$

สรุปได้ว่าอำนาจของการทดสอบของ $t-(NN,10)$ และ $T-(NN,10)$ ณ จุดนี้แตกต่างกันอย่างมีนัยสำคัญทางสถิติที่ระดับ .05 นั่นคือที่เดลต้ามีค่าเท่ากับ 1.25σ และกำหนดอัตราความคลาดเคลื่อนที่ระบุ .01 $t-(NN,10)$ มีอำนาจของการทดสอบเหนือกว่า $T-(NN,10)$
