สน พงศอารยะ : ธรณีสัณฐานวิทยาของกลุ่มแม่น้ำปิงและวัง บริเวณพื้นที่อำเภอสามเงา และอำเภอบ้านตาก จังหวัดตาก (GEOMORPHOLOGY OF THE PING AND THE WANG RIVER BASIN, AMPHOE SAM NGAO AND BAN TAK AREA CHANGWAT TAK) อ. ที่ปรึกษา รศ. ดร. ณรงค์ ธีรมงคล 151 หน้า  
ISBN 974-332-252-3

การศึกษาธรณีสัณฐานวิทยาของกลุ่มแม่น้ำปิงและวัง บริเวณพื้นที่อำเภอสามเงา และอำเภอบ้านตาก จังหวัดตาก มีวัตถุประสงค์ที่จะจำแนกขอบเขตของแต่ละธรณีสัณฐาน รวมถึงการศึกษาชนิดและลักษณะของตะกอน และเพื่อหาความสัมพันธ์ระหว่างตะกอนกับสภาพแวดล้อมการสะสมตัวในอดีต

พื้นที่ศึกษาอยู่ในบริเวณตอนเหนือของที่ราบลุ่มภาคกลางซึ่งถูกขนาบด้วยเทือกเขาทางด้านตะวันออกและตะวันตก ทางตอนเหนือของจังหวัดตาก ธรณีสัณฐานที่เกิดจากการทำงานของแม่น้ำสามารถจัดจำแนกได้เป็น 8 กลุ่ม ประกอบด้วย (1) บริเวณการสะสมตะกอนยุคเทอร์เชียรี (2) ลานตะพักลำนํ้าชั้นสูง (3) ลานตะพักลำนํ้าชั้นกลาง (4) ลานตะพักลำนํ้าชั้นต่ำ (5) ที่ราบน้ำท่วมถึง (6) ดินดินธรรมชาติ (7) ตะกอนหัวหาดของแม่น้ำ (8) สันดอนทราย

ตะกอนแม่น้ำที่สะสมตัวตั้งแต่ในยุคซีโนโซอิกตอนปลายแสดงคุณลักษณะที่คล้ายคลึงกันในส่วนของความกลมมนของก้อนกรวด การกระจายตัวของขนาดตะกอน แต่มีความแตกต่างกันเล็กน้อยในส่วนของคุณสมบัติของกรวดในบริเวณการสะสมตัวของตะกอนยุคเทอร์เชียรีและบริเวณลานตะพักลำนํ้าส่วนความแตกต่างที่สามารถพบได้อย่างชัดเจนคือ ระดับของการถูกกัดกร่อน ระดับของการกลายสภาพเป็นหิน ระดับความสูงจากระดับน้ำทะเล ความต่างระดับ และลักษณะของศิลาแลง ลักษณะของตะกอนเหล่านี้สามารถสรุปได้ว่าเกิดจากสภาวะแวดล้อมแบบแม่น้ำประสานสายที่เป็นตัวการหลักก่อให้เกิดการสะสมตัวของชั้นตะกอนที่มีความหนาแน่นมาก ๆ

การสึกกร่อนอย่างรวดเร็วและการเกิดธรณีแปรสัณฐานย่อย ๆ รวมกับการเปลี่ยนแปลงของอากาศในสมัยไพลสโตซีน มีอิทธิพลต่อวิวัฒนาการของธรณีสัณฐานในพื้นที่ศึกษา การเกิดธรณีแปรสัณฐานในยุคใหม่อาจจะป็นสาเหตุที่ทำให้เกิดการสะสมตัวของตะกอนที่มีความหนาแน่นกว่าร้อยละ 10 นอกจากนี้การเปลี่ยนแปลงของอากาศในสมัยไพลสโตซีนเป็นอีกสาเหตุที่ทำให้เกิดการเปลี่ยนแปลงของระดับอยู่ตัว ลานตะพักลำนํ้าที่มีหลายระดับซึ่งปรากฏให้เห็นในปัจจุบันสันนิษฐาน ว่าเป็นผลมาจากการเกิดธรณีแปรสัณฐานและการเปลี่ยนแปลงของอากาศในช่วงเทอร์เชียรีตอนปลาย และช่วงไพลสโตซีน

## C825862 : MAJOR GEOLOGY

KEY WORD: GEOMORPHOLOGY/PING/WANG/BAN TAK/TERRACE

SONE BHONGARAYA: GEOMORPHOLOGY OF THE PING AND THE WANG RIVER BASIN, AMPHOE SAM NGAO AND BAN TAK AREA CHANGWAT TAK. THESIS ADVISOR: ASSOC.PROF.NARONG THIRAMONGKOL, Ph.D. 151 pp. ISBN 974-332-252-3

The study of the geomorphology in the Ping and the Wang Rivers Basin, Amphoe Sam Ngao and Ban Tak area, northwestern Thailand was carried out. The aim is to delineate geomorphological units, to describe kinds and characters of sediments and to investigate the relationship between sediments and their depositional environment.

Geomorphologically, the area is situated in the north of the Central Plain, and is sandwiched by western and eastern mountain ranges to the north of Changwat Tak. Landforms in the units of fluvial origins can be divided into 8 geomorphological units including (1) Tertiary landform unit, (2) high terrace, (3) middle terrace, (4) low terrace, (5) floodplain, (6) natural levee, (7) point bar and (8) sand bar.

Late Cenozoic fluvialite sediments have been deposited in the basin. The characteristics of the deposits e.g., the roundness of pebbles and the distribution of sediments but they differ slightly in pebble's association between the Tertiary and the terrace deposits are generally similar. However, different geomorphological units are clearly different in the degree of erosion, degree of diagenesis, altitude, and lateritic features of the deposits. The features of these sediments enable to conclude that braided riverine environment has played dominant role in the area.

Rapid denudation and small tectonic adjustment in association with climatic changes influenced the evolution of landforms in the study area. Young tectonism might cause the deposition up to a hundred meter thick. Climatic changes during Pleistocene led to the variation of base level. The present elevation of terraces found at different levels assumed to have resulted from tectonism and climatic change during Late Tertiary and Pleistocene.

## ACKNOWLEDGEMENTS

The author wishes to express his sincere gratitude to the thesis supervisor, Associate Professor Dr. Narong Thiramongkol for his advice and critical suggestion during the study. In particularly, special thanks are also to Associated Professor Dr. Chaiyudh Khunthaprab who gave valuable information. The author wishes to express his appreciation to Mr. Montri Choowong, a lecturer of the Department of Geology, Chulalongkorn University for comments and proved reading during this work.

Thanks to the Department of Geology, Faculty of Science, Chulalongkorn University for the partial financial support and all research facilities.

Field work for this study were made possible by Mr. Khamawat Siritheerasas, Mr. Vichai Chutakositkanon, Mr. Preecha Jirawanwasana, Mr. Chotik Boonnark, Mr. Arom Prasansuktawee, Mr. Natthawut Nootrapao, Mr. Komut Maneechai, and Mr. Awirut Sirimongkolkitti. The author also acknowledges Mr. Tanaphol Singkaew, laboratory technician, Department of Mining, Faculty of Engineer for wet sieve analysis suggestion.

This work has benefited from discussions and comments by Assistant Professors Sompop Vedchakanachana, Dr. Nophadon Muangnoicharoen, Pongsak Phongprayoon, Veerote Daorerk, Dr. Punya Charusiri, and Dr. Thanawat Jarupongsakul of the Department of Geology, Chulalongkorn University.

The author would like to thanks Mr. Jirasak Charoenmit, Ms. Jittarat Jiamjirachat, Mr. Supot Sing-sanga, Mr. Noppadol Seetun, Mr. Thitikorn Bunyongkul, and Ms. Benjalak Sornchangwat for their assistant in the report preparation.

This thesis was made possible through the financial support of his family, Exempt Academic Fee and Graduate School Fund of Chulalongkorn University.
